

KapexAI

An affordable business and trade consultant for anyone with an idea

Project Proposal

Himkesh Tak and Shiv Shome

1. Introduction

KapexAI is a business consultant for people who cannot afford one. It is built for students, first-time founders, and small business owners: anyone with a genuine idea who cannot spend lakhs on a strategy firm.

Most AI tools answer a business question with a long block of text that is difficult to read, difficult to act on, and full of numbers that cannot be trusted. KapexAI takes a different approach. The user describes what they want to do, for example, "I want to start a mango export business," and receives a clear, visual, step-by-step plan. It sets out what the market looks like, the real numbers and margins involved, who the buyers are, what duties apply, and exactly what to do first, second, and third. Every figure is drawn from a real, named source, so it can be trusted and shared with others.

In short, KapexAI offers the value of a McKinsey-style strategist at a fraction of the cost. The approach is straightforward. KapexAI asks a few precise questions to understand the user's situation, gathers current information from reliable sources, applies proven business frameworks, and returns a decision-ready plan that is simple to follow.

2. Aim

The aim is to make good business and trade guidance affordable and within reach of anyone with an idea. To achieve this, KapexAI sets out to:

- Turn any question about how to start or grow a business into a clear, visual action plan within minutes.
- Present all guidance visually, using action paths, diagrams, and simple framework slides rather than long, unreadable text.
- Support every fact and figure with a real, cited source so that nothing is guessed or invented.
- Function like a knowledgeable consultant that guides the user through each step, rather than a simple search box.

- Remain strictly focused on business and trade strategy, with no investment or stock advice, so that it stays genuinely useful and within the bounds of the rules.

3. Problem Statement

Good business advice is locked behind a price that most people cannot pay.

Someone with a genuine idea today has three poor options. Professional consultants and strategy firms charge far more than a student or first-time founder can afford. Generic AI chatbots are inexpensive but produce long, generic answers that are difficult to act on, and they often include numbers that are outdated or simply invented. Conducting the research independently means spending weeks navigating scattered government portals, trade data, and articles, and even then, it rarely results in a clear plan.

As a result, most people either abandon a good idea or proceed on guesswork. There is no affordable tool that takes a real business question and returns a clear, visual, step-by-step plan supported by current, trustworthy data. That is the gap KapexAI is built to close.

4. Tech Stack

The system is built as a controlled, step-by-step pipeline that is predictable and easy to debug, rather than a loose collection of autonomous agents.

- **Orchestration:** LangGraph and Langchain
- **AI models:** Anthropic, OpenAI, OpenRouter
- **Backend:** FastAPI, Redis, Pydantic, Uvicorn, Python
- **Frontend:** Next.js, Tailwind CSS, and Mermaid.js
- **Quality and operations:** LangSmith, pytest, Docker, and Vercel

5. Deliverables

- A clean, chat-style web application in which the user simply describes their idea or question.
- A short, intelligent questionnaire that establishes the user's situation before producing an answer.
- A visual, step-by-step action plan for any business or trade question, such as the mango export path.
- Auto-generated framework outputs, such as SWOT, Porter's Five Forces, and a market snapshot, populated with real, cited data.
- Diagrams and simple slides as the primary output, rather than walls of text.
- A grounded data layer that draws on reliable official and trade sources, with every fact tagged to its origin.
- A built-in guardrail that keeps the product focused on business and trade strategy alone, and directs users to the appropriate professional for exact tax, customs, or legal details.
- An evaluation process that confirms every answer is accurate and properly sourced before it reaches the user.
